

SUB Moto-Tech Service Tip

NOT STARTING/RUNNING POORLY

Is your bike not starting, running poorly, or running rough after filling up? Try this first...

Ex: fuel sample

Ex: drain screws

Ex: Rust in tank

1. **Drain the carbs and catch fuel in a glass jar or clear container.**

To drain carbs:

1. Turn off the gas.
2. Have something ready to catch the gas.
3. Loosen one drain screw.
4. Then drain individually.

2. **Inspect the fuel. What do you see? Any particles or water?**

3. **If the fuel is all clear, drain all carbs.**

4. **Once drained, lightly tighten drain screw.**

5. **Turn gas back on.**

6. **Try to restart.**

*If you've already tried restarting multiple times, change the spark plugs first.

7. **Don't forget to use a light to look for rust in the gas tank.**
